Two Thirds of US Adults Believe Pharmacies Should Not Sell Tobacco

"Two-thirds of American adults believe pharmacies should not be allowed to sell tobacco, while 14 percent strongly oppose such a policy, according to data from the Centers for Disease Control and Prevention (CDC) published today [Sept. 1, 2016] in the American Journal of Preventive Medicine. Researchers also found nearly half of cigarette smokers, as well as nearly half of tobacco users who don't smoke cigarettes, support such a policy." *(CDC Press Release)* This article discusses how Americans feel about pharmacies selling tobacco products.

Teen Vaping Is Not What You Think It Is, Researchers Say

"If you're the parent of a teen and you've been reading the headlines lately, you might have heard about findings showing that teens are vaping at 'record levels' because it 'looks cool.' Even though 'vape culture' can be dangerous to their health..." "Well, maybe not so fast. A new study published this week [Aug. 21-27, 2016] in the journal Tobacco Control provides some clarity as to what, exactly, your teen is smoking when they puff away on Saturday Morning Cereal Vape Juice." *(Washington Post - Blogs)* This article reveals that the "overwhelming majority of teens who experiment with vaping—about two-thirds of them—use only the flavored vaping juices that contain absolutely no nicotine, marijuana or other drugs."

FDA Bans E-Cigarette Sales to Minors: Why Is It Cracking Down Now?

"The US Food and Drug Administration began banning sales of electronic cigarettes to minors on Monday [Aug. 8, 2016], apparently ending a contentious debate about whether e-cigarettes should be considered separately from other tobacco products. In addition to barring the sale of e-cigarettes and other tobacco products to people under 18, the rules also require a photo ID to purchase them, stop retailers from handing out free samples, and require all e-cigarettes on the market since February 2007 to undergo a federal review." *(Christian Science Monitor)* This article discusses the FDA's new regulations for electronic cigarettes.

Two Thirds of US Adults Believe Pharmacies Should Not Sell Tobacco

• Half of cigarette smokers agree

Two-thirds of American adults believe pharmacies should not be allowed to sell tobacco, while 14 percent strongly oppose such a policy, according to data from the Centers for Disease Control and Prevention (CDC) published today in the American Journal of Preventive Medicine. Researchers also found nearly half of cigarette smokers, as well as nearly half of tobacco users who don’t smoke cigarettes, support such a policy.

“People look to pharmacies to improve and support their health,” said CDC Director Tom Frieden, M.D., M.P.H. “Selling tobacco products, the leading preventable cause of death and disease, goes against the important and growing role pharmacies play in Americans’ well-being.”

A number of communities across the U.S. do not permit the sale of tobacco products in pharmacies. As of January 2016, 134 municipalities in California and Massachusetts have enacted tobacco-free pharmacy laws. Preliminary data suggest that eliminating tobacco product sales in pharmacies does not hurt business. In 2014, CVS Health became the first national retail pharmacy chain to stop selling tobacco products. After implementing the new policy, CVS Health reported that annual revenues increased in 2014 and 2015.

While pharmacies can provide evidence-based cessation support and FDA approved medications, the ceiling and floor of the conversation has always been the tobacco product itself. This study provides important data on public opinion about an important public health policy change.

• Half of cigarette smokers agree

Two-thirds of American adults believe pharmacies should not be allowed to sell tobacco, while 14 percent strongly oppose such a policy, according to data from the Centers for Disease Control and Prevention (CDC) published today in the American Journal of Preventive Medicine. Researchers also found nearly half of cigarette smokers, as well as nearly half of tobacco users who don’t smoke cigarettes, support such a policy.

“People look to pharmacies to improve and support their health,” said CDC Director Tom Frieden, M.D., M.P.H. “Selling tobacco products, the leading preventable cause of death and disease, goes against the important and growing role pharmacies play in Americans’ well-being.”

A number of communities across the U.S. do not permit the sale of tobacco products in pharmacies. As of January 2016, 134 municipalities in California and Massachusetts have enacted tobacco-free pharmacy laws. Preliminary data suggest that eliminating tobacco product sales in pharmacies does not hurt business. In 2014, CVS Health became the first national retail pharmacy chain to stop selling tobacco products. After implementing the new policy, CVS Health reported that annual revenues increased in 2014 and 2015.

While pharmacies can provide evidence-based cessation support and FDA approved medications, the selling and distribution of tobacco products is not consistent with these roles. Raising the tobacco product sales age to 21 in many states has already reduced youth tobacco use, and the federal government and several states are considering raising the age of tobacco sales to adults as well. While many believe that tobacco products should not be sold in pharmacies, the industry and policy groups continue to insist that the tobacco industry has a right to sell its products, regardless of the health consequences of tobacco use.
